FUDE0058**Description :**

MKII Advanced Hydrology Study System

Technical Specification :

This apparatus demonstrates some of the major physical processes found in hydrology and fluvial geomorphology, including: rainfall hydrographs for catchment areas of varying permeability; the abstraction of ground water by wells, both with and without surface recharge from rainfall; the formation of river features and effects of sediment transport. Realistic results can be obtained from this small scale, floor standing apparatus, which can be conveniently located and requires no special services.
